**INTRODUCTION:** *Viola odorata* is a species of the genus *Viola* native to Europe and Asia, but has also been introduced to North America and Australasia. It is commonly known as wood violet¹, The medicinal plant *Viola odorata* Linn. (Violaceae) is a popularly known as “Banafshah” and sweet violet in Asia and Europe respectively. It is found in high altitudes of Himalayas, Europe and throughout North America. It is a long trailing Plant of less than 6 inches height. The Plant has thick and scaly underground stem, with rooting runners. It possesses a heart shaped leaves with scalloped or slightly serrated edges are dark green, smooth or sometimes downy underneath, and grow in a rosette at the base of plant. Flowers are deep purple or blue to pinkish or even yellow whitish²⁻³.

Sweet violet (Viola odorata L.) Grows wild in nature, in places exposed to sun, alongside hedges, river banks, on the edges of deciduous forests and in forest glades⁴. It is wide-spread all across Croatia, along with the mentioned species, lists further 19 species of the same genus. The Mediterranean is considered to be the sweet violet’s original habitat, and nowadays it ranges from the North of Europe to South Africa, Tierra del Fuego and Australia⁴.

*Viola odorata* Linn (sweet violet) belongs to family violaceae, is an evergreen perennial herb growing about 10 cm tall. It flowers in late winter. The flowers are nodding, deep violet and sweet scented. It is distributed in Kashmir and western Himalayan regions at an altitude of 1500 to 1800 m asl. The herb is well known for its Pharmaceutical importance in Ayurvedic and Unani medicinal system. It is used for treatment of whooping cough. Its drug is also anti-inflammatory, dihoretic, diuretic, emollient, expectorant, antipyretic and laxative. It contains salicylic acid which is used to

**ABSTRACT:** Sweet violet also known as the *Viola odorata*, blooms in continental climate conditions in early spring with delicate flowers of attractive scent. It has been traditionally the part of various indigenous preparations and being used to cure respiratory and inflammatory conditions. Present review article is an attempt to cover recent developments in phytochemical and pharmacological potential of drug *Viola odorata* contains alkaloid, glycoside, saponins, methyl salicylate, mucilage and vitamin C. Traditionally *V. odorata* is worthwhile to cure Jaundice. *V. odorata* has showed anti-inflammatory, antipyretic, antibacterial activity, hepatoprotective activity. Further investigations exploring possible use of these phytochemicals as pharmacological agents are warranted. The article reviews is an attempt to compile and documented information on different aspect of *Viola odorata* pharmacological properties and highlight the need for research and their potential development.

**Keywords:** *Viola odorata*, phytochemicals, pharmacological potential, Traditional Medicine

make aspirin hence effective for the treatment of headaches, migraine and visominia. The roots of the plant yield an alkaloid violin which is used as an expectorant. There is a general feeling that the populations of V. Odorata are decreasing at an alarming rate. The plants of this genus are known to hybridize at intra- and inter-specific levels very freely in nature. Therefore, taxonomically it has become very difficult to distinguish between the different species, with the result that the drug is highly adulterated with other congeners viz. Viola biflora, V. Cinerea, V. Pilosa, V. Cauescens and V. Sylvestris. 

Sweet violet is used for the treatment of bronchitis, common digestive disorders, postoperative tumor metastasis, diabetes and cancer. Phytochemically, different groups of compounds have been isolated from various species of this genus like cyclotides, flavonoids, alkaloids and triterpenoids. Some of them already have been scientifically accepted as antifungal, antibacterial, anticancer, antioxidant, antiasthmatic, anti-inflammatory, anti-HIV and antipyretic agents. The plant is conventionally propagated through the divisions of rhizomatous disc, but for large scale cultivation the use of the seeds is preferred. However, the germination rate of this medicinal plant is low due to sever seed dormancy.

Seed dormancy is a physiological occurrence in some medicinal plants caused by external or internal factors such as hard seed coat, immature embryo, rudimentary embryo and inhibitors materials and needs to temperature changes prevent of seed germination, even in optimal conditions. Seed germination has also prevented due to the embryo is constrained by its surrounding structures such as seed coat and endosperm. It is possible to release dormancy by removing the surrounding structures in seed and scarification, embryo culture and endosperm culture techniques are applied to break seed dormancy.

Thermodormancy which is expressed as germination in a narrower temperature range. Low temperatures and/or pre-chilling treatments are considered as the common approach in order to break seed dormancy in Violaceae family. It is reported that for some species of pansy (Viola), germination at high temperatures (>30°C) can be inhibited by thermodormancy. To overcome thermodormancy, cold stratification and growth regulators such as Gibberellic acid alone and/ or in combination with Kinetin and Ethylene also plays an important role to increase the germination rate of the seeds in Viola odorata.

Chemical constituents:
Viola odorata contains alkaloid, glycoside, saponins, methyl salicylate, mucilage and vitamin C. About 30 cyclotides are identified from the aerial parts and roots of Viola odorata, 13 of which are novel sequences. The aqueous preparations of Viola odorata L. Flowering tops revealed the presence of anthocyanins.

The analysis of essential oil composition of the leaves of Viola odorata L. revealed the presence of 25 identified compounds, representing 92.77% of the oil with butyl-2-ethylhexylphthalate (30.10%) and 5,6,7,7a-tetrahydro-4,4,7a-trimethyl-2(4H)-benzofuranone (12.03%) being the two main components. Viola odorata also produces macrocyclic peptides. According to the HS-SPME GC/MS analyses, ethyl hexanoate and (2E,6Z)-nona-2,6-dienol were specific volatile compounds of the sample with French origin, while (E,E)-hepta-2,4-dienal, hexanoic acid, limonene, tridecane, and eugenol were specific of the samples with Egyptian origin.

Additional compounds that were not detected by HS-SPME GC/MS analysis were revealed by GC-O analyses, some of them being markers of origin. Pent-1-en-3-ol, 3-methylbut-2-enal, 2-methoxy-3-(1-methylethyl)pyrazine, 4-ethylbenzaldehyde, β-phenethyl formate, and 2-methoxy-3-(2-methylpropyl)pyrazine revealed to be odorant markers of the French sample, whereas cis-rose oxide, trans-rose oxide, and 3,5,7-trimethylcyclohex-2-enone were odorant markers of the Egyptian samples. A naturally occurring linear cyclotide, violacin A is isolated from the plant Viola odorata. The GC-MS analysis of active fraction revealed the presence of methanolic and ethanolic extracts of Viola odorata showed the presence of Pentane 2,3,4-Trimethyl (45%), N-Hexadecanoic acid

International Journal of Pharmacognosy
Pharmacological activity:
Antioxidant Activity:
The plant has been reported to possess antioxidant\textsuperscript{7} and diuretic\textsuperscript{23} activities. The data obtained in the in vitro models clearly establish the antioxidant potency of all extracts\textsuperscript{24}. Flowers of spicy violet, \textit{Viola odorata} (Violaceae), were collected from two different locations—The flowers were extracted with water and the suspension filtered and lyophilized for 3 days.

Extracts showed antioxidant potential using scavenging of 2,2-diphenyl-1-picylhydrazyl radical\textsuperscript{25}.

Headache and insomnia:
It can be helpful in treatment of headaches, insomnia, dizziness and exhaustion\textsuperscript{26}.

Sedative and pre anesthetic:
The leaf extract has sedation and pre anesthetic effects at dose of 100-400mg/kg\textsuperscript{27}.

Bronchitis and cough:
The whole aerial part including stem, flowers and leaves are used in bronchitis, cough, sneezing\textsuperscript{28-29}.

Kidney and liver disorders:
The whole aerial part including stem, flowers and leaves are used in bronchitis, cancer, cough, fever, urinary infections, rheumatism, sneezing, kidney and liver disorders. Supplementation of the animal diets with sweet violet (\textit{Viola odorata} L.) blossoms powder SVBP (0.2 to 1.6 g/100g) prevented significantly (p≤0.05) the rise of mean serum AST, ALT and ALP activities; urea, creatinine and MDA levels\textsuperscript{30}.

Laxative activity:
The extract is shown to be safe up to of 2000 mg/kg body weight by fixed dose method. Diuretic activity of different extracts has been studied and it was found that urine output and Na+ and K+ level was more in case of aqueous extract at a dose level of 400 mg/kg as compared to control animals. Laxative activity of different extracts has been studied and it was found that alcoholic extracts at a dose level of 200 mg/kg and aqueous extract at a dose level of 400 mg/kg showed significant effect as laxative\textsuperscript{31}.

(28.85%), 10- Undecyn-1-ol (14.43%) and Pentadecanoic acid (8.14%)\textsuperscript{22}.

Antipyretic activity:
*Viola odorata* produced a significant oral antipyretic activity in rabbits using hexane, chloroform and water soluble extracts. Antipyretic activity was more prominent in the hexane-soluble portions of these plants.

Cancer and Antitumor activity:
The whole aerial part including stem, flowers and leaves are used in cancer. *Viola* was reported as pharmacological tools and possibly as leads to antitumor agents. Cycloviolacin O₂ (cyo2), a cyclotide from *Viola odorata* (Violaceae) has antitumor effects and causes cell death by membrane permeabilization. This study documents several cyclotides with robust cytotoxicity that may be promising chemosensitizing agents against drug resistant breast cancer.

Antimicrobial activity:
The results of the study show that cyclotides from Iranian *V. odorata* have potent antimicrobial activity against gram-negative, plant pathogenic bacteria. The results of the study show that cyclotides from Iranian *V. odorata* have potent antimicrobial activity against gram-negative, plant pathogenic bacteria. Cyo2 is a cyclotide isolated from *Viola odorata* with potent activity against Gram-negative bacteria. Methanol and ethanol extracts of the leaves of *V. odorata* L. were found effective against all tested strains of bacteria whereas fungi showed resistance to all extracts. Ethanolic extract exhibited higher inhibition against *E. coli* (10 mg/ml), *Bacillus subtilis* (20 mg/ml), *Staphylococcus aureus* (20 mg/ml) and *Pseudomonas aeruginosa* (40 mg/ml). Hence, *V. odorata* is used in the treatment of bronchitis, cystitis and tonsillitis.

Antidislipidemic and anti hypertensive activity:
These data indicate that the vasodilator effect of the plant which possibly explain the fall in BP. The plant also showed reduction in body weight and antidislipidemic effect which may be due to the inhibition of synthesis and absorption of lipids and antioxidant activities. Thus, this study provides a pharmacologic rationale to the medicinal use of *Viola odorata* in hypertension and dyslipidemia. Cycloviolacin O₂, isolated from the plant *Viola odorata*, is shown to have potent effects against fouling barnacles (*Balanus improvisus*), with complete inhibition of settlement at a concentration of 0.25 microm. Cycloviolacin O₂, a plant peptide of the cyclotide family, isolated from *Viola odorata* is shown to have potent effects against fouling barnacles (*Balanus improvisus*), with complete inhibition of settlement at a concentration of 0.25 microm. A combination of two aqueous extracts of, *Viola odorata*, and *Ruta graveolens*, with concentrations of 0.15625, 0.3125, 10-20 mg/cm³ significantly inhibited the growth of Trichomonas vaginalis cultured in (CM161) medium during periods of 24, 48, 72, and 96 hrs.

Cytotoxic activity:
Cycloviolacin O₂ isolated from the *Viola odorata* exhibited strong cytotoxic activities, which varied in a dose-dependent manner.

Repellency against mosquitoes:
The oils Violet (*Viola odorata*) which induced a protection time of 8 h at the maximum and a 100% repellency against Aedes, Anopheles, and Culex mosquitoes.

Molluscicidal Activity:
Crude cyclotide extracts from *Viola odorata* plants showed molluscicidal activity comparable to the synthetic molluscicide metaldehyde.

Anti-inflammatory Activity:
An aqueous extract of *Viola odorata* showed anti-inflammatory properties as compared with hydrocortisone. *Viola odorata* extract given prophylactically was partially effective in preventing lung damage, equal to the effect of hydrocortisone in aiding the resolution of formalin-induced lung damage.

CONCLUSION: The present review article was concluded that the *Viola odorata* contains various phytoconstituents and different phytocomponents which are responsible for various pharmacological actions of *Viola odorata*. However, more investigations must be carried out to evaluate the mechanism of action of medicinal plants with different activities. In future the work on isolation of the compounds and establish a pharmacological
agent for the treatment of different diseases is useful from the natural sources.
